

Your task — create a Portable composting system

Research, plan, design and construct a functioning composting system to recycle food scraps, garden waste and other materials for garden use.

- ♣ Collect materials to use, these should be mostly recycled or repurposed materials. Do not go out and buy brand new.
- ♣ Construct your portable compost system and start the composting process. (Start early July to have made compost by Ag day)
- ♣ You will need to produce a diary with your compost system, to show the judges your research, design and construction process. Your project will not be included in judging without this diary. This should include photos, from start to finish, hand drawn designs and research.

Remember your portable compost system needs to be transported to school to be judged and on display for Ag Day. It does not need to be full of compost on Ag Day, just a small sample will be acceptable.

Personalise your portable compost system with your own unique flare.

We can't wait to see your creations.

Happy composting whānau!
